### BaseParameter 存储格式说明

## 1. baseparameter 结构:

```
struct disp_info {
    struct drm_display_mode resolution;
    struct overscan scan;
    enum output_format format;
    enum output_depth depthc;
    unsigned int feature;
    struct hwe_inital_info hwe_info;
    struct bcsh_info bcsh;
    unsigned int reserve[128];
    struct lut_data mlutdata;
};
struct file_base_paramer
{
    struct disp_info main;
    struct disp_info aux;
};
```

main,aux 分别保存主副屏信息,main 的信息存储在 baseparameter 前 8kb 的空间内,aux 偏移为 8kb。

disp\_info 的大小不为 8kb, 因此 main 和 aux 读取和写入的时候需要分开, lseek 8kb 之后再读写 aux。

### 2. Disp\_info 说明

drm\_display\_mode:

存储分辨率的时序信息

```
struct drm_display_mode {
    /* Proposed mode values */
                    /* in kHz */
     int clock;
     int hdisplay;
     int hsync_start;
     int hsync_end;
     int htotal;
     int vdisplay;
     int vsync_start;
     int vsync_end;
     int vtotal;
     int vrefresh;
     int vscan;
     unsigned int flags;
     int picture_aspect_ratio;
};
```

#### • Overscan:

存放缩放相关:

```
struct overscan {
    unsigned int maxvalue;
    unsigned short leftscale;
    unsigned short rightscale;
    unsigned short topscale;
    unsigned short bottomscale;
};
```

• output\_format:

```
颜色格式,属性字符串为 Auto 时,选择 output_ycbcr_high_subsampling
```

```
enum output_format {
    output_rgb=0,
    output_ycbcr444=1,
    output_ycbcr422=2,
    output_ycbcr420=3,
```

```
output_ycbcr_high_subsampling=4, // (YCbCr444 > YCbCr422 > YCbCr420 > RGB)
output_ycbcr_low_subsampling=5, // (RGB > YCbCr420 > YCbCr422 > YCbCr444)
invalid_output=6,
};
```

#### Output\_depth:

色深,属性字符串为Auto时,选择Automatic

```
enum output_depth{
    Automatic=0,
    depth_24bit=8,
    depth_30bit=10,
};
```

#### • Feature:

feature 目前有如下 flag,配置分辨率以及颜色的 AUTO 模式,是否开启 hdcp1x,是否过滤分辨率列表

```
#define RESOLUTION_AUTO (1<<0)
#define COLOR_AUTO (1<<1)
#define HDCP1X_EN (1<<2)
#define RESOLUTION_WHITE_EN (1<<3)
```

#### • hwc\_inital\_info:

配置 FrameBuffer 大小, fps,以及主副屏的挂载设备

```
struct hwc_inital_info {
    char device[128];
    unsigned int framebuffer_width;
    unsigned int framebuffer_height;
    float fps;
};
```

device 例子:HDMI-A,TV Fps 可以用来限制帧率

#### bcsh\_info :

保存 bcsh 信息, 取值范围 0~100, 默认值都是 50

```
struct bcsh_info {
    unsigned short brightness;
```

```
unsigned short contrast;
unsigned short saturation;
unsigned short hue;
};
```

#### Reserve:

```
unsigned int reserve[128];
预留信息,供以后使用。
```

#### • lut\_data:

保存 lut 表信息,size 表示每个 rgb lut 表中有多少个数据,最大为 1024。

```
struct lut_data{
        uint16_t size;
        uint16_t lred[1024];
        uint16_t lgreen[1024];
        uint16_t lblue[1024];
};
```

# 3. Backup

由于有恢复出厂设置的需求,baseparameter的后半部分用来保存初始数据,起始偏移 512kb。
